Predictive Services Discussion: The upper level trough will move into the Pacific Northwest as a surface cold front moves east across Montana and Idaho. This will lead to scattered showers and storms across both the Pacific Northwest and possibly into the Northern Rockies. Breezy southwesterly winds may be a concern across Northern California and the Great Basin. Hot conditions are expected across Southern California as high pressure off shore begins to move east toward the coast. To the south, the monsoonal flow over New Mexico and Colorado will begin to show signs of weakening as less convection develops. The very hot and humid ridge of high pressure over the East will remain in place over the Ohio River Valley.

Ash Pit Hazards

Miscellaneous Fireline Hazards

Ash pits are an inherent and hidden risk to wildland firefighters that can cause severe burns and injuries. Ash pits are created when a ground fire consumes underground fuels creating an empty space that is imperceptible from the surface.

- Environmental factors that increase the risk of ash pit formation after a wildfire:
 - Extensive root systems of trees and shrubs.
 - Deep duff or peat, the organic layer covering mineral soil.
 - Landscapes that have once been cultivated or manipulated by heavy equipment, old dozer piles, sawmills, timber sale yards or decking areas.
 - Small rodent holes that have become filled with decadent combustible debris, beaver holes near dams and stream beds, badger and coyote dens.
 - White ash is sometimes an indicator of ash pits as are swarms of hovering insects.
 - With the sun behind the suspected ash pit, look for small nearly translucent smokes that dissipate quickly above the ground.
 - Ash pits often give off the smell of incomplete combustion or of creosote burning.

- Mitigation measures to consider:
 - Identification of high risk landscape.
 - Identify and flag all hazardous discovered ash pits.
